Down-regulation or out-competition of Mlo function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also be used for identifying compounds able to stimulate a defence response in a plant by interaction with encoded polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim

                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of the MLO gene, wild-type Mlo exerts a negative regulatory function on a pathogen defence response, such that mutants exhibit a defence response in the absence of pathogen. Down-regulation or out-competition of Mlo function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also be used for identifying compounds able to stimulate a defence response in a plant by interaction with encoded polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Key

                                                                        This sequence represents the coding region for the wheat fungal resistance gene TrMlol. The Mlo protein confers resistance to fungal pathogens by stimulating the formation of large cell wall appositions, designated papillae, at the contact site with the fungal pathogen. These papillae mainly contain callose, but also contain carbohydrate, phenols and proteins and are used to prevent penetration of the fungal hyphae into the plant. The new Mlo sequences are used to generate transgenic plants resistant to fungal pathogens, especially Erysiphe
                                                                                                                                                                                                                                                                                                                         Triticum

In barley, mutations at the MIO locus are responsible for a plant resistant pathotype. The mechanism of MIO resistance involves the formation of large cell wall appositions, called papillae, at pathogen contact sites. Papillae mainly contain callose, but also carbohydrates, phenols and proteins. Polynucleotides encoding MIO proteins are useful for making transgenic plants, preferably wheat, which are resistant to fungal pathogens.

```
The present sequence is a putative coding sequence for a Mlo homologue from wheat. It was identified by searching a root and leaf cDNA library for sequences encoding proteins similar to Mlo from Hordeum vulgare (barley) and Arabidopsis thaliana. Mlo confers resistance to Erysiphe graminis f. sp. hordei upon the plant, and its inactivation leads to the priming of disease resistance even if the pathogen is not present. The gene and protein can be used to create transgenic plants which have increased disease resistance, as well as allowing researchers to find other resistance-conferring genes and proteins.

                                                                                                                                                                                  This sequence represents the coding region for the wheat fungal resistance gene TrMlo2. The Mio protein confers resistance to fungal pathogens by stimulating the formation of large cell wall appositions, designated papillae, at the contact site with the fungal pathogen. These papillae mainly contain callose, but also contain carbohydrate, phenols and proteins and are used to prevent penetration of the fungal hyphae into the plant. The new Mio sequences are used to generate transgenic plants resistant to fungal pathogens, especially Erysiphe graminis (powdery mildew).
                                                                                                                                                                                                                                                                                                                                                                                                            (NOVS)

In barley, mutations at the Mlo locus are responsible for a plant resistant pathotype. The mechanism of Mlo resistance involves the formation of large cell wall appositions, called papillae, at pathogen contact sites. Papillae mainly contain callose, but also carbohydrates, phenols and proteins. Polynucleotides encoding Mlo proteins are useful for making transgenic plants, preferably wheat, which are resistant to fungal pathogens.

The Mlo protein confers resistance to fungal pathogens by stimulating the formation of large cell wall appositions, designated papillae, at the contact site with the fungal pathogen. These papillae mainly contain callose, but also contain carbohydrate, phenols and proteins and are used to prevent penetration of the fungal hyphae into the plant. The new Mlo sequences are used to generate transgenic plants resistant to fungal pathogens, especially Erysiphe graminis (powdery mildew).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes a Mlo protein. Mlo proteins given resistance to fungal pathogens which infect living epidermal plant cells. Mlo proteins give proteins resistance to fungal pathogens, especially Erysiphe graminis (powdery mildews). In barley, mutations at the Mlo locus are responsible for a plant resistant pathotype. The mechanism of Mlo resistance involves the formation of large cell wall appositions, called papillae, at pathogen contact sites. Papillae mainly contain callose, but also carbohydrates, phenols and proteins. Polynucleotides encoding Mlo proteins are useful for making transgenic plants, preferably wheat, which are resistant to fungal pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SAON)

  The sequence is that of a homologue of the MIO gene, wild-type MIO exerts a negative regulatory function on a pathogen defence response, such that mutants exhibit a defence response in the absence of pathogen. Down-regulation or out-competition of MIO function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also be used for identifying compounds able to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is that of a homologue of the MLO gene, wild-type Mlo exerts a negative regulatory function on a pathogen defence response, such that mutants exhibit a defence response in the absence of pathogen. Down-regulation or out-competition of Mlo function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also be used for identifying compounds able to stimulate a defence response in a plant by interaction with encoded polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated Mlo gene of production of transgenic resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

Down-regulation or out-competition of MIO function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also be used for identifying compounds able to stimulate a defence response in a plant by interaction with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated Mlo gene of production of transgenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a putative coding sequence for a Mlo homologue from wheat. It was identified by searching a root and leaf cDNA library for sequences encoding proteins similar to Mlo from Hordeum vulgare (barley) and Arabidopsis thaliana. Mlo confers resistance to Erysiphe graminis f. sp. hordei upon the plant, and its inactivation leads to the priming of disease resistance even if the pathogen is not present. The gene and protein can be used to create transgenic plants which have increased disease resistance, as well as allowing researchers to find other resistance-conferring genes and proteins.

It was identified by searching a seed cDNA library for sequences encoding proteins similar to Mlo from Hordeum vulgare (barley) and Arabidopsis thaliana. Mlo confers resistance to Erysiphe graminis f. sp. hordei upon the plant, and its inactivation leads to the priming of disease resistance even if the pathogen is not present. The gene and protein can be used to create transgenic plants which have increased disease resistance, as well as allowing researchers to find
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New

```

```
The present cDNA sequence (ATCC 98727) encodes maize MLO6 (ZmMLO6) protein. Mlo6 gene is mapped to chromosome 5. It is a mutation-induced recessive allele, that confers resistance to plant pathogens. Expression of native Mlo genes in plants can be altered by transforming them with a DNA construct comprising the mutated Mlo gene. Decreasing the expression or activity of native Mlo protein leads to enhanced resistance of plants against pathogens such as fungi, virus, nematodes and insects. Mlo gene molecular markers used in breeding programs aimed at improving disease resistance. MLO protein has anti-infective, antipathogenic, antivital, antifungal, antihelminthic and anti-arthropod activity.
